

## EDM Paramedic Tracker Update

The First Point of Contact (FPC) indicator will be retired. The MASK indicator will replace the FPC indicator to improve the visibility of the point of entry screening and mask compliance. The MASK indicator adds the ability to identify patients whose screening has not been completed, improving overall compliance and infection control oversight

- A red box  displays in the MASK field when point of entry screening has not been completed
- The red box disappears once screening is documented and patient screens negative.
- If patient screens positive, the appropriate MASK (green or red) will display
  - **MSK** – patient screened positive and mask has been documented as applied
  - **MSK** – patient screened positive and mask has not been applied or the patient refused

Point of entry screening status

Positive TB Risk  
Positive Respiratory Risk  
Negative TB difficult Risk

Mask applied: Yes

**MSK** – patient screened positive, and mask has been documented as applied

Point of entry screening status

Positive TB Risk  
Positive Respiratory Risk  
Negative TB difficult Risk

Mask applied: No

**MSK** – patient screened positive, and mask has not been applied or the patient refused
